-1-

NAVIGATION SYSTEM FOR A MULTICHANNEL DIGITAL TELEVISION
SYSTEM

5 The present invention relates to a multichannel digital television system and, in particular, aspects of a system relating to navigation between channels.

One of the advantages of digital television lies in the number of channels that are available in such systems and the flexibility that is available to the television service provider regarding what channel choices may be made available to a subscriber of the
10 service. Other than a standard set of subscription channels, the system may also include other access controlled channels such as, for example, a pay-per-view channel enabling a subscriber to pay for a particular film, sporting event etc.

In addition, the digital television system may allow access by the viewer to a number
15 of other interactive type services, such as text based programme guides, weather maps etc. These services may be associated with dedicated digital television channels used to carry the information. Other additional menu based services may be provided enabling a user to access certain basic information in a series of pull down menus whilst watching a broadcast programme. These services operate using so-called
20 "pilot" information carried in the same channel as a normal audiovisual channels.

Whilst the viewer benefits from the increased choice available, the large numbers of channels and services that are available may prove distracting and, in practice, a viewer may often have difficulty managing the viewing possibilities available. In
25 addition, existing navigation tools often fail to handle correctly the interface between the navigator and access controlled channels, some of which may not be available to a particular user.

It is an object of the present invention in its broadest and/or specific aspects to
30 overcome some or all of these problems and to facilitate the navigation of the channels by a user whilst respecting access control restrictions.

-2-

In a first aspect, the present invention provides a decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means, for example, an interface, for receiving access rights to one of a programme and a channel, and means, for example, a central processor, for prohibiting full audio and visual access by the user to said one of a programme and a channel when displayed in a said window according to the received access rights.

The use of mosaic format displays of available channels to aid channel navigation is known in the field. However, such mosaic tools allow full access by a user to all available channels, albeit in a reduced form. If digital audio for this channel is also available a user can watch and listen, for example, to the entire of a programme normally only available upon special subscription or payment but here displayed in one window of the mosaic display. The present invention overcomes this problem.

This aspect of the present invention extends to a digital television system comprising a decoder adapted to display a plurality of digital television channels in a mosaic formation, wherein access rights to a programme or channel are received and analysed by the decoder in determining whether to permit or prohibit full audio and visual access by the user to that programme or channel when displayed in a mosaic window.

The decoder preferably comprises means for receiving access rights data together with audiovisual data for creating the mosaic. In order to allow the user to obtain full access rights to a programme and/or channel, the decoder preferably comprises means for issuing a request for full audio and visual access to one of a channel and a programme displayed in a window.

The access rights information may be used by the decoder in a number of ways. For example, in an implementation where a cursor is used to select a desired channel and audio information is generated by the decoder in response to the positioning of the cursor, the decoder may be adapted to permit or prohibit the generation of audio

-3-

information for an access controlled programme or channel.

Thus, the decoder preferably comprises means for generating a cursor for display with the mosaic formation, the cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation. The decoder may comprise means for generating audio information associated with a particular channel in response to the positioning of the cursor over a said window displaying said particular channel, and may also comprise means for prohibiting the generation of said audio information according to the received access rights.

Audio information may be disabled for access controlled programmes or channels at all times if the decoder does not have the associated access rights. Alternatively, audio information may be prohibited if the cursor is positioned on a prohibited mosaic window for longer than a predetermined length of time. Thus, the prohibiting means may be adapted to prohibit the generation of said audio information if the cursor is positioned over said window for longer than a predetermined length of time.

In yet a further embodiment, the interaction of the cursor with a mosaic window may depend on the access rights associated with the programme or channel displayed in that window. For example, the decoder may be adapted to automatically re-position the cursor in the event that the cursor is placed on a prohibited mosaic window corresponding to an access controlled programme or channel. Thus, the decoder preferably comprises means for automatically re-positioning the cursor in the event that the cursor is placed over a said window displaying one of a programme or a channel to which full audio and visual access is prohibited.

This re-positioning may be carried instantaneously, in the sense that the decoder does not allow a cursor to be positioned directly on an access controlled programme or channel displayed in a mosaic window. Alternatively, the repositioning may be carried out after the expiry of a predetermined period of time. Thus, the repositioning means is preferably adapted to reposition the cursor after the expiry of

-4-

a predetermined period of time. In the case, for example, where an audio soundtrack is activated if a window is highlighted by a cursor, this time delay allows a user to have full access to a sample of programme for a period of time to enable the user to evaluate the interest of this programme.

5

The repositioning of the cursor need not depend on the access rights to a channel and/or programme displayed in a window. For example, in addition to or as an alternative to the above the decoder may comprise means for automatically repositioning the cursor after the expiry of a predetermined period of time. This can enable a user to "surf" across the mosaic, receiving for this predetermined period of time audio information for each window of the mosaic in turn. This surfing mode of operation can be initiated by pressing a pre-designated button on a remote controller.

15 As an alternative to repositioning the cursor after the expiry of a predetermined period of time, the decoder may be adapted to issue automatically a request for full access rights to a channel and/or programme to which full audio and visual access is prohibited in the event that the cursor is placed over the window displaying said channel and/or programme for a predetermined period of time. This can enable automatic ordering of the full access rights to a programme and/or channel without any further input from the user.

25 In addition or as an alternative to the above steps, the decoder may also be adapted to generate a message informing a user of the lack of access rights to a programme or channel in the event of the placement of the cursor on a prohibited mosaic window. Thus, the decoder may comprise means for generating a message informing a user of the access rights to one of a programme and a channel in the event of the positioning of the cursor on a said window displaying said one of a programme and a channel.

30

Alternatively, or in addition, the decoder may simply prohibit the generation of video information in a mosaic window in dependence on the access rights associated with

-5-

the programme or channel normally displayed in that window. Thus, the decoder may comprise comprising means for prohibiting the generation of at least a portion of video information in a said window in dependence on the access rights to one of a programme and a channel displayed in that window.

5

Full access by the viewer to at least a portion of the video information displayed in a window may be prohibited by utilising one or more of a number of different methods. For example, the decoder may comprise means for controlling the display of a picture in said window instead of said at least a portion of video information.

10 The picture may comprise a logo associated with the channel displayed in said window, or an image associated with the programme displayed in said window. Alternatively, the decoder may comprise means for controlling the display of an advertisement in said window instead of said at least a portion of video information.

15 In another alternative, the decoder may comprise means for controlling the display of further video information in said window instead of said at least a portion of video information. This further video information may comprise promotional video information, such as a trailer for a forthcoming programme to be shown on the channel displayed in the window.

20

Access rights to a programme and/or channel typically comprise information regarding the nature of the programme or channel, such as, for example, whether the channel is a subscription channel, whether the programme is a pay-per-view event and so on. As well as being utilised to permit or prohibit full video and audio access to
25 the programme and/or channel when displayed in a window of a mosaic formation, these and other access rights may be used by the decoder to customise various features of the display.

For example, the decoder may comprise means for changing an attribute of the cursor
30 depending on a characteristic of at least one of the programme and channel displayed in a window over which the cursor is positioned. This characteristic may comprise, for example, the rating (such as adult only, or children's programme) of the

programme, the subject matter (for example, sport, wildlife, politics) of the programme, whether the programme is a pay-per-view event, and so on. In addition, programmes and/or channels may be grouped according to a user's selection, for example, of favourite channels, and the cursor attribute changed accordingly
5 whenever it is positioned over a window displaying one of the user's favourite channels. This can ease user identification of certain channels and programmes displayed in the mosaic formation.

Thus, in another aspect of the present invention there is provided a decoder for
10 controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for generating a cursor for display with the mosaic formation, said cursor being movable to select a desired channel within the mosaic formation, and means for changing an attribute of the cursor depending on a characteristic of at least one of a programme and a channel
15 displayed in a window over which the cursor is positioned.

In one embodiment, the changing means is arranged to change the colour of said cursor depending on said characteristic of at least one of a programme and a channel displayed in the window over which the cursor is positioned. However, other
20 attributes of the cursor, such as the size and shape, may be changed according to this characteristic.

The decoder may comprise means for receiving data for assigning said characteristic from a remote control handset associated with the decoder and means for assigning
25 said characteristic in response to said received data. This can enable the user to assign a channel as a favourite channel using the remote controller, for example, by pressing a predetermined button of the controller when the cursor is positioned over the window displaying that channel. Alternatively, the decoder may comprise means for generating a list of channels displayed in the mosaic formation, the user, by
30 pressing appropriate buttons on the remote controller, selecting channels from the list as the favourite channels.

When the user presses a predetermined button on the remote controller when the cursor is positioned over a window, the decoder may be arranged to perform one of a number of operations. For example, the decoder may comprise means for tuning the decoder to a channel displayed in the desired window upon selection of the desired
5 window. This can enable the selected channel to be displayed "in full" on the television screen upon selection of the window displaying that channel.

As an alternative, or in addition, the decoder may comprise means for generating a display comprising information regarding the programme displayed in the desired
10 window upon selection of the desired window. For example, a short summary of the programme shown on the channel, together with start time, duration and/or end time, may be displayed upon pressing a predetermined button of the remote controller when the cursor is positioned over the window displaying that channel. Thus, the present invention provides a decoder for controlling the display of a plurality of digital
15 television channels in respective windows of a mosaic formation, said decoder comprising means for generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation, and means for generating a display comprising information regarding the programme displayed in the desired
20 window upon selection of the desired window.

This information may be received by the decoder together with the audiovisual data for that programme and stored in memory of the remote controller for retrieval and display at the request of the user. Alternatively, the decoder may download this
25 information as and when required for display. In another alternative, the decoder may comprise means for communicating with a communications centre to obtain said information regarding the programme displayed in the desired window. The communication means may comprise a modem for dialling up said communications centre to supply a request for said information to the communications centre.

30

The decoder may further comprise means for generating a display comprising a forthcoming programme schedule for the channel displayed in the desired window

-8-

upon selection of the desired window. This schedule may be received by the decoder together with the audiovisual data for the displayed channel. Alternatively, the decoder may download this schedule as and when required for display. In another alternative, the decoder may comprise means for communicating with a communications centre to obtain the schedule. The communication means may comprise a modem for dialling up said communications centre to supply a request for the schedule to the communications centre.

Thus, the present invention extends to a decoder for displaying of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation, and means for generating a display comprising a forthcoming programme schedule for the channel displayed in the desired window upon selection of the desired window.

The forthcoming programme schedule may comprise a textual display of programme schedule information. Alternatively, the forthcoming programme schedule may comprise a display of a plurality of pictorial images associated with respective forthcoming programmes in respective windows of a mosaic formation. Thus, the present invention further extends to a decoder for controlling the display of programming schedule information, said decoder comprising means for generating a display comprising a plurality of pictorial images associated with respective forthcoming programmes on at least one digital television channel in respective windows of a mosaic formation.

The plurality of pictorial images may be associated with forthcoming programmes to be shown simultaneously on respective digital television channels. For example, these forthcoming programmes may be shown on respective digital television channels during a future time period. When the cursor is positioned over one of the images, information regarding the programme, such as the title, start time, duration and/or end time of the programme may be displayed.

At least one of said plurality of pictorial images may comprise video footage associated with the respective forthcoming programme.

In one embodiment, the receiving means is adapted to receive said access rights from a remote control handset associated with the decoder. This can enable the user to prevent video and/or audio access to one or more of the channels displayed in windows of the mosaic formation, for example, the user may wish to restrict all access to channels which normally show adult programmes. For example, when the cursor is positioned over a window to which the user wishes to restrict all access, the user can, by pressing one or more buttons on the remote control, instruct the decoder to prevent all access to the channel displayed in that window.

Preferably, the receiving means is adapted to receive a PIN number from the remote control handset, said decoder comprising means for authenticating the received PIN number and, upon authentication of the received PIN number, permitting reception of the access rights. This can add a level of security to the transmission of access rights, thereby preventing the access rights to be altered by an unauthorised user.

In one mode of operation, the channels are displayed in a formation which is determined by the broadcaster of the audiovisual data for the channels. Thus, various favourite channels of the user may be randomly spread about the mosaic formation. In order to enable the positions of the various windows in the formation, in one embodiment, the decoder comprises positional control means for controlling the relative positions of said windows within the mosaic formation. In one arrangement, the positional control means may be arranged to control the relative positions of said windows in response to the received access rights to the channels or programmes displayed in said windows. For example, pay-per-view programmes and channels to which the user does not have full access rights may be shown in neighbouring windows of the mosaic formation.

30

Thus, the present invention extends to a decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation,

-10-

said decoder comprising positional control means for controlling the relative positions of said windows within the mosaic formation.

In one embodiment, the positional control means is arranged to control the relative positions of said windows in response to received window positioning data for controlling the relative positions of said windows within the mosaic formation. In one arrangement, the decoder comprises means for receiving from a remote control handset associated with the decoder said window positioning data. This can enable the relative positions of the windows in the mosaic formation to be changed easily by the user, for example, by pressing one or more buttons of the remote control. Thus, the present invention also extends to a decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for receiving from a remote control handset associated with the decoder window positioning data, and positional control means for controlling the relative positions of said windows within the mosaic formation in response to the received positioning data.

The positional control means may be arranged to control the relative positions of the windows of the mosaic formation according to a programme characteristic of programmes normally shown on the channels displayed in the windows. For example, the positional control means may be arranged to group together windows which normally show programmes having the same theme, such as sport, wildlife, children's programmes, adult programmes, and so on. Additionally, or alternatively, the positional control means may be arranged to group together windows which display channels which normally show pay-per-view events.

The positional control means may be arranged to maintain a window displaying one of a particular channel and a particular programme in a constant position in the mosaic formation. For example, that window may be that window of the mosaic formation displaying the channel displayed immediately before the display of the mosaic formation.

-11-

The present invention also provides a decoder comprising:

- means for storing a plurality of interactive applications;
- means for generating a display comprising a plurality of pictorial images in
respective windows of a mosaic formation, each pictorial image being associated with
- 5 a respective interactive application;
- means for generating a cursor for display with the mosaic formation, said
cursor being selectively movable over the windows of the mosaic formation to enable
selection of a desired window within the mosaic formation; and
- means for executing an interactive application upon selection of the window
- 10 displaying a pictorial image associated with that interactive application

The invention further extends to a digital television system comprising a decoder as
aforementioned and transmission means adapted to transmit access rights data together
with the audiovisual data used to create the mosaic. This information may comprise

15 a configuration list, updated every 24 hours or so and listing the access rights for
programmes to be broadcast for the next 24 hour period. Upon reception of the list,
the decoder may compare the access rights with the rights available to the decoder
before carrying out the steps described above.

- 20 The transmission means may further be adapted to receive audiovisual information
from a plurality of channels and to process this information in dependence on the
access rights to each programme or channel forming the mosaic. For example, in the
case of an adult emission or an adult channel, it may be preferable to simply black
out at all times the corresponding mosaic window that should show this channel. As
- 25 will be appreciated, this may be carried out in addition or as an alternative to the
steps carried out at the decoder to limit the mosaic display and/or movement of the
cursor.

The present invention also provides a method of controlling the display of a plurality

30 of digital television channels in respective windows of a mosaic formation,
comprising receiving access rights to one of a programme and a channel, and
prohibiting full audio and visual access by the user to said one of a programme and

-12-

a channel when displayed in a said window according to the received access rights.

The present invention also provides a method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, comprising generating a cursor for display with the mosaic formation, said cursor
5 being movable to select a desired channel within the mosaic formation, and changing an attribute of the cursor depending on a characteristic of at least one of the programme and channel displayed in the window over which the cursor is positioned.

10 The present invention also provides a method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, comprising generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation, and generating a display
15 comprising information regarding the programme displayed in the desired window upon selection of the desired window.

The present invention also provides a method of displaying of a plurality of digital television channels in respective windows of a mosaic formation, comprising
20 generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation, and generating a display comprising a forthcoming programme schedule for the channel displayed in the desired window upon selection of the desired window.

25

The present invention also provides a method of controlling the display of programming schedule information, comprising generating a display comprising a plurality of pictorial images associated with respective forthcoming programmes on at least one digital television channel in respective windows of a mosaic formation.

30

The present invention also provides a method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation,

-13-

comprising controlling the relative positions of said windows within the mosaic formation.

- 5 The present invention further provides a method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, comprising receiving from a remote control handset associated with the decoder window positioning data, and controlling the relative positions of said windows within the mosaic formation in response to the received positioning data.
- 10 The present invention also provides a method of controlling a decoder, said method comprising the steps of:
- storing a plurality of interactive applications;
 - generating a display comprising a plurality of pictorial images in respective windows of a mosaic formation, each pictorial image being associated with a
 - 15 respective interactive application;
 - generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation; and
 - executing an interactive application upon selection of the window displaying
 - 20 a pictorial image associated with that interactive application.

Apparatus features as described are also applicable to method aspects of the present invention, and vice versa.

- 25 As used herein, the term "digital television system" includes any transmission system for transmitting or broadcasting for example primarily audiovisual or multimedia digital data. Whilst the present invention is particularly applicable to a broadcast based digital television system, the invention may also be applicable to a fixed telecommunications network for multimedia internet applications, to a closed circuit
- 30 television network, and so on. The term equally includes a system using any satellite, terrestrial, cable or other communication link.

-14-

The term "decoder" or "receiver/decoder" used herein may connote a receiver for receiving either encoded or non-encoded signals, for example, television and/or radio signals, which may be broadcast or transmitted by some other means. The term may also connote a decoder for decoding received signals. Embodiments of such receiver/decoders may include a decoder integral with the receiver for decoding the received signals, for example, in a "set-top box", such a decoder functioning in combination with a physically separate receiver, or such a decoder including additional functions, such as a web browser or a video recorder or a television.

There will now be described, by way of example only, a preferred embodiment of the present invention, with reference to the attached figures, in which:

Figure 1 shows a digital television system as may be adapted according to the present invention;

Figure 2 shows an overview of the elements of a decoder for use in a digital television system;

Figure 3 shows a handset remote control for use with the decoder of Figure 2;

Figure 4 shows a screen display associated with a first embodiment of a mosaic of channels;

Figure 5 shows the cursor in a different position in the screen display of Figure 4;

Figure 6 shows another screen display associated with a mosaic of channels

Figure 7 shows subscription information in the screen display of Figure 6 when the user does not have full rights to a channel;

Figure 8 shows the elements of a transmission system associated with the generation of the mosaic;

-15-

Figure 9 shows a screen display associated with a second embodiment of a mosaic of channels;

Figure 10 shows a cursor positioned in the screen display of Figure 9;

5

Figure 11 shows subscription information in the screen display of Figure 9 when the user does not have full rights to a channel;

Figure 12 shows a screen display of an electronic programme guide in the form of a mosaic of windows;

10

Figure 13 shows a screen display associated with a mosaic of radio channels;

Figure 14 shows a screen display of information relating to a radio channel; and

15

Figure 15 shows a screen display associated with a mosaic of interactive applications.

An overview of a digital television system 1 is shown in Figure 1. The invention includes a mostly conventional digital television system 2 that uses the known MPEG-2 compression system to transmit compressed digital signals. In more detail, MPEG-2 compressor 3 in a broadcast centre receives a digital signal stream (typically a stream of video signals). The compressor 3 is connected to a multiplexer and scrambler 4 by linkage 5.

The multiplexer 4 receives a plurality of further input signals, assembles the transport stream and transmits compressed digital signals to a transmitter 6 of the broadcast centre via linkage 7, which can of course take a wide variety of forms including telecommunications links. The transmitter 6 transmits electromagnetic signals via uplink 8 towards a satellite transponder 9, where they are electronically processed and broadcast via notional downlink 10 to earth receiver 12, conventionally in the form of a dish owned or rented by the end user. The signals received by receiver 12 are transmitted to an integrated receiver/decoder 13 owned or rented by the end user and

25
30

-16-

connected to the end user's television set 14. The receiver/decoder 13 decodes the compressed MPEG-2 signal into a television signal for the television set 14.

Other transport channels for transmission of the data are of course possible, such as
5 terrestrial broadcast, cable transmission, combined satellite/cable links, telephone networks etc.

In a multichannel system, the multiplexer 4 handles audio and video information received from a number of parallel sources and interacts with the transmitter 6 to
10 broadcast the information along a corresponding number of channels. In addition to audiovisual information, messages or applications or any other sort of digital data may be introduced in some or all of these channels interlaced with the transmitted digital audio and video information.

15 A conditional access system 15 is connected to the multiplexer 4 and the receiver/decoder 13, and is located partly in the broadcast centre and partly in the decoder. It enables the end user to access digital television broadcasts from one or more broadcast suppliers. A smartcard, capable of deciphering messages relating to commercial offers (that is, one or several television programmes sold by the broadcast
20 supplier), can be inserted into the receiver/decoder 13. Using the decoder 13 and smartcard, the end user may purchase commercial offers in either a subscription mode or a pay-per-view mode.

As mentioned above, programmes transmitted by the system are scrambled at the
25 multiplexer 4, the conditions and encryption keys applied to a given transmission being determined by the access control system 15. Transmission of scrambled data in this way is well known in the field of pay TV systems. Typically, scrambled data is transmitted together with a control word for descrambling of the data, the control word itself being encrypted by a so-called exploitation key and transmitted in
30 encrypted form.

The scrambled data and encrypted control word are then received by the decoder 13

-17-

having access to an equivalent to the exploitation key stored on a smart card inserted in the decoder to decrypt the encrypted control word and thereafter descramble the transmitted data. A paid-up subscriber will receive, for example, in a broadcast monthly ECM (Entitlement Control Message) the exploitation key necessary to
5 decrypt the encrypted control word so as to permit viewing of the transmission.

An interactive system 16, also connected to the multiplexer 4 and the receiver/decoder 13 and again located partly in the broadcast centre and partly in the decoder, enables the end user to interact with various applications via a modern back
10 channel 17. The modem back channel may also be used for communications used in the conditional access system 15. An interactive system may be used, for example, to enable the viewer to communicate immediately with the transmission centre to demand authorisation to watch a particular event, download an application etc.

15 Referring to Figure 2, the elements of the receiver/decoder 13 or set-top box will now be described. The elements shown in this figure will be described in terms of functional blocks.

The decoder 13 comprises a central processor 20 including associated memory
20 elements and adapted to receive input data from a serial interface 21, a parallel interface 22, a modem 23 (connected to the modem back channel 17 of Fig. 1), and switch contacts 24 on the front panel of the decoder.

The decoder is additionally adapted to receive inputs from an infra-red remote control
25 25 via a control unit 26 and also possesses two smartcard readers 27, 28 adapted to read bank or subscription smartcards 29, 30 respectively. The subscription smartcard reader 28 engages with an inserted subscription card 30 and with a conditional access unit 29 to supply the necessary control word to a demultiplexer/descrambler 30 to enable the encrypted broadcast signal to be descrambled. The decoder also includes
30 a conventional tuner 31 and demodulator 32 to receive and demodulate the satellite transmission before being filtered and demultiplexed by the unit 30.

-18-

Processing of data within the decoder is generally handled by the central processor 20. In the case of received audio and video signals, the MPEG packets containing these signals will be demultiplexed and filtered so as to pass real time audio and video data in the form of a packetised elementary stream (PES) of audio and visual data to
5 dedicated audio and video processors or decoders 33, 34. The converted output from the audio processor 33 passes to a preamplifier 35 and thereafter via the audio output of the receiver/decoder. The converted output from the video processor 34 passes via a graphic processor 36 and PAL/SECAM encoder 37 to the video output of the receiver/decoder.

10

With reference to Figure 2, the graphic processor 36 is preferably designed to generate a screen display combining moving images together with overlaid text or other images. More specifically it can combine 4 layers; a stills layer, a moving image layer, a graphics layer, and a cursor layer. The graphic processor 36
15 additionally receives graphic data for display (such as generated images etc) from the central processor 20 and combines this information with information received from the video processor 34 to generate the screen display.

The software architecture of the central processor may correspond to that used in a
20 known decoder and will not be described here in any detail. It may be based, for example, on a virtual machine interacting via an interface layer with a lower level operating system implemented in the hardware components of the decoder. In terms of the hardware architecture, the decoder will be equipped with a processor, memory elements such as ROM, RAM, FLASH memory etc. as in known decoders.

25

The central processor 20 may be adapted to run a number of applications defining the functionality of the decoder. An application introduced into the decoder corresponds to a section of code introduced into the machine that permits the control, for example, of higher level functions of the machine. Typical applications may include the
30 generation of a graphic sequence on the screen of the television display in response to a command from the remote control, or the emission of a message via the decoder modem to the server associated with the digital broadcast system.

-19-

As will be later described, an application according to the present invention is adapted to generate display screens, cursors and programme information laid over or replacing the normal television display and associated with navigation between a number of channels or interactive services proposed by the system. The information displayed
5 may comprise substantially invariable menu data and/or data updated using information contained in the MPEG transport stream of one or more channels.

Applications may be resident applications stored in the ROM or FLASH of the decoder or applications broadcast and downloaded via an interface of the decoder or,
10 indeed, such as the serial interface 21, a smart card reader 27 etc. Applications can include navigation tools, program guide applications, games, interactive services, teleshopping applications, as well as initiating applications to enable the decoder to be immediately operational upon start-up and applications for configuring the decoder.

15 Applications are stored in memory locations in the decoder and represented as resource files comprising graphic object description files, unit files, variables block files, instruction sequence files, application files, data files etc.

Conventionally, applications downloaded into the decoder via the broadcast link are
20 divided into modules, each module corresponding to one ore more MPEG tables. Each MPEG table may be divided into a number of sections. In the case where data transfer also occurs via the serial and parallel ports, modules are similarly split into tables and sections, the size of the sections depending on the channel used.

25 In the case of broadcast transmission, modules are transported in the form of data packets within respective types of data stream, for example, a video data stream, an audio data stream, a text data stream. In accordance with MPEG standards each packet is preceded by a Packet Identifier (PID) of 13 bits, one PID for every packet transported in the MPEG stream. For a given frequency channel, one or more
30 programme map tables (PMTs) contain a list of the different data streams within that channel and define the content of each stream by reference to its respective PID. The PMT table or tables are accessible via a principal Programme Access Table (PAT).

-20-

In a digital broadcast system, information is carried on a plurality of frequency channels of a fixed and predetermined bandwidth. Within a single frequency channel, a plurality of audio and/or visual data streams may be contained. For example, a single video stream may be associated with a plurality of audio streams, dubbing the programme into a number of languages. Alternatively or in addition, multiple video streams may be contained in the packet stream associated with the frequency channel and showing, for example, the same sporting event from different camera positions. Whilst these different audio and video streams are broadcast within the same frequency channel, the viewer may perceive changing the audio/video stream within that frequency channel as corresponding to a real change of channel.

In addition to conventional audiovisual programme information, other data may be carried in a frequency channel. As will be described below, this data may include menu display information associated with up-dated programme summaries etc. The PID values of such data may again be available via a PMT table.

In order to provide a constant interface, some information is of necessity broadcast on all frequency channels. For example, the information associated with a "Pilot" type application indicating basic programme information and options available to a user may be broadcast on all frequency channels, such that a user may always call up this information, regardless of the programme or channel being watched. In this way, continuity of the interface is assured.

Referring to Figure 3, the set of controls associated with the remote control handset of the receiver/decoder will now be described. This remote control layout corresponds to that currently supplied with the existing Canal+ Mediahighway digital decoder system. As will be understood, the response by the decoder to the activation of a particular control on the handset is programmable and may vary according to the application loaded in the decoder. Thus, while certain functions (on/off, mute etc.) are universal, others may change according to the decoder configuration.

As shown, the handset includes a PROG control 40 and PILOT control 41. In the

-21-

existing Canal+ Mediahighway decoder system, these controls respectively call up a programme guide listing the programmes available on each channel and a pilot application giving information regarding the programme being watched on the present channel as well as a certain amount of information regarding other programmes to be shown on this and other channels at that moment, in the near future etc.

In the context of present application, activation of the PROG control 40 of the handset calls up a more generalised main service menu, the programme guide being accessible as an option within this menu, alongside other services such as interactive shopping applications etc. The application called up by the PILOT control 41 remains largely unchanged.

The handset further includes a set of directional navigation buttons 42 for controlling movement of an on-screen cursor within a menu display, as well as an "OK" control button 43 for selection of an item highlighted by the cursor.

A set of numerical buttons 44 enable direct selection of a numbered channel, entry of numerical data such as credit card numbers, PIN numbers etc. The numerical controls 44 may also be associated with entry of a secondary set of data, such as the days of the week, day/night/evening etc. This data may be printed above the controls and can be used when programming a timer application, navigating a programme guide etc.

The handset 25 further includes a preference control button 45 giving access to a menu list of a limited number of preferred channels, as chosen by the user. In this way, the user can channel quickly between the channels that he or she watches the most often. The control button 46 is used to exit from an activated application or display menu.

30 The SERV control button 47 is used to call up a summary of the services available within an activated application, such as a users guide to a shopping application.

-22-

The "+" control button 48 gives access to a menu permitting choice of sub-titles in a number of languages and/or choice of language used in the audio soundtrack accompanying the displayed programme.

- 5 The PERSO control button 49 calls up an application enabling a user to set and personalise certain basic functions of the decoder, including the volume of the audio output from the decoder, characteristics of the video output of the decoder etc.

The A to E control buttons 50 are not generally associated with a particular type of
10 function but may be used by certain applications and at the option of the programmer to activate particular functions such as return to a previous menu etc.

Finally, the mute control button 51 deactivates or activates the sound accompanying the displayed channel, the TV/SAT control 52 enables the user to switch between
15 channels received via a satellite input and those received via a terrestrial antenna, and the standby button 53 enables the user to remotely switch the decoder on and off.

Referring to Figure 4, one of the services offered is a grille or mosaic formation showing the content of all channels currently being broadcast to the decoder. Upon
20 selection of this service, the decoder changes to the frequency channel associated with this service and the mosaic 80 shown in Figure 4 is displayed. In this embodiment, the mosaic 80 is broadcast on channel number 8 and so when the numerical button "8" is selected on the remote control the decoder tunes to this frequency channel. In an alternative embodiment, the remote control may include a dedicated control button
25 for tuning to this frequency channel.

The mosaic 80 is composed of a number of miniature screen display windows 81 each showing in real time the programme being shown on a channel and each including at
82 an indication of the name of the channel shown in the display window 81. The
30 mosaic also includes a general information bar 84.

An application within the decoder generates a movable frame cursor shown at 83.

-23-

- This cursor may be moved horizontally and vertically using the navigation arrows of the remote control. For example, in Figure 5, the cursor 83 has been moved to select the third-down, third-across window. The title of the programme currently being shown on the channel displayed in this window is displayed in the display bar 84.
- 5 The decoder additionally selects and plays the audio stream associated with this channel. Pressing "OK" on the remote control then causes the decoder to tune to the channel shown in that window.

- The mosaic shown in Figure 4 displays 20 channels. In practice, up to 60 or more
- 10 channels may be receivable by the decoder. In this case, access to other programme mosaics may be necessary. For example, when the cursor is positioned over window 84" as shown in Figure 4, selection of the right facing navigation arrow will cause the display to change to another mosaic of 20 programmes, as shown in Figure 6. Similarly, when the cursor is in the left hand side of the grille 80, selection of the left
- 15 facing navigation arrow will cause the display to change to show another programme mosaic. The mosaic screens may also be looped such that exit of the last mosaic screen will bring the user back to the first screen etc.

- The programme mosaic shown in Figure 4 displays a selection of all programme
- 20 channels broadcast to the decoder. However, in some cases, the decoder may not possess full access rights to all channels. For example, some channels may be dedicated to pay per view programming, or may require a further subscription on the part of user. In this case, it is undesirable that a user has full audio and video access to a programme, even to a reduced screen version shown in the display windows 81.
- 25

- Accordingly, in one embodiment the decoder application managing the mosaic display is adapted to monitor the length of time that the frame cursor rests in one position. After a period of, for example, 30 seconds, the application will compare the access rights of the channel in question with the access rights in the decoder in order to
- 30 verify whether or not a user has full access to the programme or channel displayed in the mosaic window.

-24-

In the event that the decoder does not have the necessary access rights, the application acts to cut the audio output after 30 seconds such that the user can no longer hear the soundtrack associated with that programme.

- 5 In the event that the user does not have the necessary access rights, the frame cursor will jump to another window in this mosaic, such as the first element in the upper left hand corner of the first screen. Alternatively, the cursor may jump to a window element in a different mosaic. For a period of 5 minutes or so thereafter, the application may refuse to allow the cursor to be repositioned on the access prohibited
10 window.

- In this event, the application may propose to the user the option of paying to access the channel in question, as shown at 86 in Figure 7. If the user agrees, the application may change directly to the channel in question using, for example, credits
15 stored in the subscription card of the user. Alternatively, the application may activate payment menu screens needed to allow the user to open a subscription. Such steps are standard, and will not be discussed here in any detail. As rights to pay-per-view events are purchased, the controller 20 may, under the control of an application, generate a cartoon image or icon representing the purchase of an event. For
20 example, the controller may generate a cartoon image of a shopping trolley which begins to fill as events are purchased.

- In an alternative to a time out procedure, the application can take the necessary steps to reposition the cursor and/or cut the audio output immediately the cursor rests on
25 a window element for an access prohibited programme or channel.

- The repositioning of the cursor need not depend on the access rights to a channel and/or programme displayed in a window. For example, in addition to or as an alternative to the above the decoder application may be arranged to automatically re-
30 position the cursor after the expiry of a predetermined period of time. This can enable a user to "surf" across the mosaic, receiving for this predetermined period of time audio information for each window of the mosaic in turn. This surfing mode

-25-

of operation can be initiated by pressing a pre-designated button on the remote control.

As an alternative to repositioning the cursor after the expiry of a predetermined period of time, the application may be adapted to issue automatically a request for full access rights to a channel and/or programme to which full audio and visual access is prohibited in the event that the cursor is placed over the window displaying this channel and/or programme for a predetermined period of time. This can enable automatic ordering of the full access rights to a programme and/or channel without any further input from the user.

In addition, or as an alternative, to cutting the audio output the application may also act to cut the video output. In some cases, for example, where adult material is displayed, the decoder may in all cases black out the video and audio display for the programme and channel in question, such that only the channel and programme title information is displayed in the bars 84, 82. Since such material may be deleted from all mosaic displays, regardless of the decoder access rights, this step may also be carried out upstream of the decoder at the transmission end.

Referring to Figure 8, the architecture of the elements of the transmission system associated with the generation of the mosaic channel will now be described. Video signals from sixty channels are received by a server 90 associated with a station 91. The server 90 acts to filter out these video signals which are not to be included in the mosaic, for example, video signals associated with adult only channels etc. The processed signals then pass to a processor 92 which resizes and repositions the video signals within a screen display so as to generate the three grille or mosaic screens shown at 93, which are then fed to the multiplexer 4.

In a similar manner, audio signals from each of the channels are filtered at 94 and assembled and assigned PID values at 95 before being fed to the multiplexer 4.

In addition to the broadcast audio and visual data, further data may be introduced by

-26-

an SA/DA injection server 96 and an associated work station 97. In particular, the server and station introduce configuration data relating to the configuration of the elements in the mosaic together with pilot data containing the minimum information regarding the programmes broadcast on each channel. The pilot data may correspond to that used by the "Pilot" application and will be used by the application to generate the information bar 84 of the mosaic screen.

The configuration data typically includes a description of the number of mosaics, the size and position of each screen element within each mosaic, the desired size of the frame cursor, the limits of the cursor movement. This information will be used to enable the associated decoder application to correctly position and move the frame cursor. In addition, the data includes the position of each channel in the mosaics (page number and coordinates), the PID of the associated audio soundtrack in the assembled audio stream and the channel reference in the pilot data.

15

In order to enable the decoder application to change directly to a desired channel the configuration data should also include the details of the channel (frequency, PID value) associated with a given element. Access details (pay per view, subscription etc.) may also be included in order to enable the decoder application to carry out the operations described above to prevent a user from watching and listening to an access prohibited channel. Finally, the configuration data includes the PID value of each mosaic page and a default header message (if any) associated with that mosaic page.

An example of a mosaic formation in which at least a portion of the video output is blacked out is described below with reference to Figures 9 to 11.

The mosaic 100 is broadcast on channel number 1 and so when the numerical button "1" is selected on the remote control the decoder tunes to this frequency channel. In an alternative embodiment, the remote control may include a dedicated control button for tuning to this frequency channel.

The mosaic 100 is composed of a miniature screen display window 101 showing in

-27-

real time a channel showing trailers for forthcoming events to be shown on one or more of the other channels, and four miniature screen display windows 102 each showing in real time the programme being shown on a respective channel. The mosaic also includes a general information bar 104, and a time and date bar 106. In addition to the mosaic windows 101, 102, the mosaic formation 100 includes button items 108, the purpose of which is described below.

When the mosaic 100 is first activated, the audio output is associated with the channel displayed in window 101 and, as shown in Figure 9, the general information bar 104 informs the user as to how to navigate around the mosaic formation 100. Upon pressing one of the navigation arrows of the remote control, an application within the decoder generates a movable frame cursor over one of the windows 102, as shown at 110 in Figure 10, or one of the button items 108. This cursor may be moved horizontally and vertically using the navigation arrows of the remote control.

The button items 108 provide rapid access to one of the channels as identified by the text appearing in each button item. For example, positioning the cursor over the button item 108 bearing the words "CANAL SATELLITE" and pressing "OK" causes the decoder to tune to the CANAL SATELLITE frequency channel.

With the cursor 110 positioned over one of the windows 102, the title of the programme currently being shown on the channel displayed in that window is displayed in the general information bar 104. The decoder additionally selects and plays the audio stream associated with this channel. Pressing "OK" on the remote control then causes the decoder to tune to the channel shown in that window.

As discussed above with reference to Figures 4 to 7, in some cases, the decoder may not possess full access rights to all channels. For example, some channels may be dedicated to pay per view programming, or may require a further subscription on the part of user. In this case, it is undesirable that a user has full audio and video access to a programme shown in the display windows 102. Restriction of the video output in the mosaic formation 100 is particularly desirable, as the window 102 is

sufficiently large for a viewer to watch comfortably a programme for which he may not have full access rights.

Accordingly, in one embodiment the decoder application managing the mosaic display
5 is adapted to monitor the length of time that the frame cursor 110 rests in one position. After a period of, for example, 30 seconds, the application will compare the access rights of the channel in question with the access rights in the decoder in order to verify whether or not a user has full access to the programme or channel displayed in the mosaic window 102.

10

In the event that the decoder does not have the necessary access rights, the application acts to switch the audio output to that associated with the channel displayed in window 101, and move the cursor accordingly (in this embodiment, the cursor is not generated when the audio output is associated with the channel displayed in window
15 101, although this is not essential). At substantially the same time, the video output for the channel displayed in the mosaic window 102 is cut as indicated at 112 in Figure 11, thereby preventing the user from watching the programme. In this event, the application may propose to the user the option of paying to access the channel in question, as shown at 104 in Figure 11.

20

The "black out" of the video output to one or more of the windows 102 may be achieved by simply cutting the video output to the portion of the screen in which the window is positioned. However, the black out may be achieved by any one of a number of different techniques, as discussed below.

25

As mentioned earlier, the decoder typically includes a 4-layer structure for generating the image to be displayed on the television set, the 4 layers being a stills layer, a moving image layer, a graphics layer, and a cursor layer. The graphics layer is preferably utilized for both icons (typically geometric shapes) and titles (usually but
30 not always subtitles). The decoder application can control the display of text, images or a combination of text and images in the stills layer to overlay at least a portion of the mosaic window 102, thereby obscuring the video image displayed in that window.

-29-

This text and/or image display can take any suitable form. For example, the application may control the generation of:

- (i) a box, rectangle or other geometric shape to at least partially overlay the window;
- 5 (ii) a logo for the channel displayed in that window;
- (iii) a textual advertisement for a programme either currently being displayed, or to be displayed in the future on, that channel; and/or
- (iv) a still image associated with a programme either currently being displayed, or to be displayed in the future, on that channel.

10

These portions of the display may be previously stored in memory of the decoder for retrieval and use as required. For example, the text and/or image may be downloaded by the decoder together with the audiovisual information for the mosaic formation 100.

15

By providing an additional moving image layer, the mosaic window 102 may alternatively, or additionally, be blacked out by a promotional video clip for that channel. This video clip may also be downloaded by the decoder together with the audiovisual information for the mosaic formation 100.

20

The decoder may be programmed such that a mosaic channel will always be displayed at start-up of the decoder. Additionally, whilst the cursor may also be fixed on the same channel every time the mosaic formation is first activated, other possibilities exist. For example, when activating the decoder, a mosaic may be displayed with the
25 cursor highlighting the last channel viewed by the user. When changing between mosaic screens, one channel may be seen on all of the screens. For example, in Figures 5 and 6 channel 9 is displayed. Equally, when the user changes from one channel to the mosaic channel, the mosaic screen including this channel highlighted by the cursor may be displayed, providing a sort of "zoom-out" effect from a full-
30 screen channel display to a miniature version in one window element of the mosaic.

In the embodiments described above, pressing the "OK" button when the cursor is

-30-

positioned over a particular mosaic window causes the decoder to tune to the frequency of the channel displayed in that particular mosaic window. However, pressing an alternative button on the remote control can activate one of a number of different applications stored in the decoder. For example, pressing one of the numerical buttons B to E (button A typically being reserved for adjustment of the volume setting, as shown in Figure 4) may cause the decoder to launch an electronic programme guide (EPG) associated with the channel displayed in the window over which the cursor is positioned.

10 The EPG can take one of many forms. For example, the EPG may comprise a textual display of a schedule of forthcoming programmes on the channel. Such displays are well known in the art and will not be described further here. Alternatively, as shown in Figure 12, the EPG may comprise a mosaic display 120 comprising a plurality of mosaic windows 122 (although only three windows are shown in Figure 12, any number or arrangement of windows is possible). Each window includes an image (still or moving) of the forthcoming programme together with an indication 124 of the title of that programme. The mosaic also includes a general information bar 126 indicating the channel name and the time period covered by the mosaic 120.

20

An application within the decoder generates a movable frame cursor shown at 127. This cursor may be moved horizontally and vertically using the navigation arrows of the remote control. Positioning of the cursor over a window causes the title and duration of the programme to be displayed, as shown at 128 in Figure 12, together with a summary of the contents of the programme, as shown as 130 in Figure 12.

25

Access to other EPG mosaics displays for that channel may be necessary to display programmes shown during a later time period. For example, when the cursor is positioned over window 122 on the right hand side of the mosaic, selection of the right facing navigation arrow will cause the display to change to another mosaic of 3 programmes to be shown during a later time period. Similarly, when the cursor is in the left hand side of the mosaic 120, selection of the left facing navigation arrow

30

-31-

will cause the display to change to show another mosaic of 3 programmes shown, or to be shown, during an earlier time period.

The EPG may be launched by tuning the decoder to a frequency channel containing the mosaic formation 120. Alternatively, the EPG may be received by the decoder together with the audiovisual information for the mosaic formations 80 and 100.

In addition to, or alternatively to, the form of EPG described with reference to Figure 12, the EPG may take the form of the mosaic formation 80 shown in Figure 4 in order to display information regarding programmes to be shown on all of the channels at a given time. In this example, each window 81 displays a still or moving image from a programme to be shown at a particular time on that channel, for example one hour in the future. The particular time is preferably indicated in information bar 84. Movement of the cursor around the mosaic formation causes the title of the selected programme to be displayed in the information bar 84. Selection of a predetermined button on the remote controller causes the EPG to display a similar mosaic for a different time, for example two hours in the future.

As an alternative to, or in addition to, launching an EPG, pressing one of the buttons B to E can cause the decoder to display further information about the programme shown in the window over which the cursor is positioned. This information preferably includes the title of the programme, start time, end time and/or duration, and a summary of the contents of the programme. This further information may be received by the decoder together with the audiovisual information for the mosaic information. Alternatively, it may be downloaded by the decoder as and when required for display.

In the embodiments of the mosaic formation described with reference to Figures 4 to 11, the cursor maintains a constant size and format (colour, shape, etc) as it is moved across the mosaic. Alternatively, the format of the cursor may vary depending on a characteristic of the window over which the cursor is positioned. In one embodiment, the application may change the colour of the cursor depending on the access rights

-32-

assigned to the programme and/or channel displayed in the window over which the cursor is positioned. For example, the cursor may be green if the user has full access rights to the programme and channel displayed in the window over which the cursor is positioned, and red if the user does not have full access rights to the programme and/or channel displayed in the window over which the cursor is positioned.

The cursor may also change depending on characteristics other than these particular access rights. For example, the user can assign a particular channel as a "favourite" channel, for example, by pressing a predetermined button on the remote control when the cursor is positioned over the window displaying that channel. The assignment of this channel as a favourite channel is stored in the memory of the decoder, so that when the cursor is subsequently positioned over the window displaying that channel, the cursor is displayed in a different colour, for example, blue. As an alternative to selecting a favourite channel via the mosaic formation, an application stored in the decoder may display a list of all of the channels received by the decoder, the user selecting various channels on the list as the favourite channels using the remote control.

In addition to this "favourite channel" selection using the cursor, the format of the cursor may vary depending on the nature of the programme displayed in the window over which the cursor is positioned. For example, the cursor may take a different format depending on the rating (such as children's programme, adults only) of the programme, the subject matter (such as sport, wildlife, politics) of the programme, and so on.

In another arrangement, the visual and/or audio black out of certain windows of the mosaic formation may be additionally determined by the user. For example, the user may wish to restrict all access to channels which normally show adult programmes if such access is not restricted by the broadcaster. By pressing a button of the remote control when the cursor is positioned over a window displaying a programme and/or channel to which the user wishes to restrict access, the user can instruct the decoder to prevent all access to that channel. This information is stored in the decoder so

-33-

that when the mosaic formation is subsequently activated, the video and audio information for that channel is blacked out. To ensure security, the decoder may request that a PIN number is entered by the user before the access rights are altered.

- 5 In the embodiments described with reference to Figures 4 to 11, the channels are displayed in a formation which is determined by the broadcaster of the audiovisual data for the channels. Thus, various favourite channels of the user may be randomly spread about the mosaic formation. In order to enable the positions of the various windows in the formation, in one embodiment, the decoder application is arranged
10 to control the relative positions of the windows within the mosaic formation.

As mentioned earlier, the decoder receives configuration data from the broadcaster which includes a description of the number of mosaics and the size and position of each screen element within each mosaic. The decoder application is able to re-
15 arrange the received positional information so that the positions of the screen elements on the screen meet the requirements of the user.

In one arrangement, the decoder application is arranged to control the relative positions of the windows of the mosaic in response to the received access rights to
20 the channels or programmes displayed in the windows. For example, pay-per-view programmes and channels to which the user does not have full access rights may be shown in neighbouring windows of the mosaic formation.

Alternatively, or in addition, the decoder application may be arranged to control the
25 relative positions of the windows of the mosaic in response to commands output from the remote control. This can enable the relative positions of the windows in the mosaic formation to be changed easily by the user, for example, by pressing one of the buttons B to E of the remote control. For example, the mosaic windows may be sorted by theme, such as sport, wildlife, children's programmes, adult programmes,
30 and so on at the touch of a button.

Figures 4 to 12 have illustrated arrangements of mosaic formations of windows

-34-

displaying programmes shown on television channels. However, the mosaic formation is not limited to solely television programmes. For example, the mosaic formation 80 shown in Figure 4 may include one or more windows associated with respective radio channels. If so, the mosaic windows for these radio channels display
5 a logo for the radio station.

The decoder may also receive frequency channels associated with other mosaic formations. By way of example, Figure 13 illustrates a mosaic formation 140 of windows 142, each window displaying a logo of a radio channel and, at 144, an
10 indication of the name of the channel shown in the window 142. The mosaic also includes a general information bar 146. An application within the decoder generates a movable frame cursor shown at 148. This cursor may be moved horizontally and vertically using the navigation arrows of the remote control. For example, in Figure 5, the cursor 83 has been moved to select the first-down, third-across window. An
15 indication of the music currently being played on the channel displayed in this window is displayed in the information bar 146. The decoder additionally selects and plays the audio stream associated with this channel.

Pressing "OK" on the remote control then causes the decoder to generate the display
20 of further information associated with the selected channel. For example, as shown in Figure 14, pressing "OK" on the remote control causes the decoder to generate a display 150 of additional information regarding the show currently being transmitted by that channel. Alternatively, pressing "OK" can cause the decoder to display a textual schedule of forthcoming music to be played on the channel. or further
25 information regarding the current piece of music being played.

Figure 15 illustrates a mosaic formation 160 of windows 162 each associated with a respective interactive application stored in the memory of the decoder. Each window contains a logo for the application together with an indication 164 of the name of the
30 application. An application within the decoder generates a movable frame cursor shown at 166. This cursor may be moved horizontally and vertically using the navigation arrows of the remote control. For example, in Figure 15, the cursor has

-35-

been moved to select the first-down, second-across window. Pressing "+" on the remote control causes the interactive application associated with that logo, for example a teleshopping application, to be launched.

CLAIMS

1. A decoder for controlling the display of a plurality of digital television
5 channels in respective windows of a mosaic formation, said decoder comprising
means for receiving access rights to one of a programme and a channel, and means
for prohibiting full audio and visual access by the user to said one of a programme
and a channel when displayed in a said window according to the received access
rights.
- 10 2. A decoder according to Claim 1, comprising means for receiving access rights
data together with audiovisual data for creating the mosaic.
3. A decoder according to Claim 2, comprising means for issuing a request for
15 full audio and visual access to one of a channel and a programme displayed in a
window.
4. A decoder according to any preceding claim, comprising means for generating
a cursor for display with the mosaic formation, said cursor being selectively movable
20 over the windows of the mosaic formation to enable selection of a desired window
within the mosaic formation.
5. A decoder according to Claim 4, comprising means for generating audio
information associated with a particular channel in response to the positioning of the
25 cursor over a said window displaying said particular channel.
6. A decoder according to Claim 5, comprising means for prohibiting the
generation of said audio information according to the received access rights.
- 30 7. A decoder according to Claim 6, wherein the prohibiting means is adapted to
prohibit the generation of said audio information if the cursor is positioned over said
window for longer than a predetermined length of time.

-37-

8. A decoder according to Claim 3 and any of Claims 4 to 6, wherein the issuing means is arranged automatically to issue said request when said cursor has been positioned over that window for a predetermined period of time.
- 5 9. A decoder according to any of Claims 4 to 7, comprising means for automatically re-positioning the cursor in the event that the cursor is placed over a said window displaying one of a programme or a channel to which full audio and visual access is prohibited.
- 10 10. A decoder according to Claim 9, wherein said repositioning means is adapted to reposition the cursor after the expiry of a predetermined period of time.
11. A decoder according to any of Claims 4 to 10, comprising means for changing an attribute of the cursor depending on a characteristic of at least one of the
15 programme and channel displayed in a window over which the cursor is positioned
12. A decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for generating a cursor for display with the mosaic formation, said cursor
20 being movable to select a desired channel within the mosaic formation, and means for changing an attribute of the cursor depending on a characteristic of at least one of a programme and a channel displayed in a window over which the cursor is positioned.
13. A decoder according to Claim 11 or 12, wherein said changing means is
25 arranged to change the colour of said cursor depending on said characteristic of at least one of a programme and a channel displayed in the window over which the cursor is positioned.
14. A decoder according to any of Claims 11 to 13, comprising means for
30 receiving data for assigning said characteristic from a remote control handset associated with the decoder and means for assigning said characteristic in response to said received data.

-38-

15. A decoder according to any of Claims 4 to 14, comprising means for tuning the decoder to a channel displayed in the desired window upon selection of the desired window.

5 16. A decoder according to any of Claims 4 to 14, comprising means for generating a display comprising information regarding the programme displayed in the desired window upon selection of the desired window.

10 17. A decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation, and means for generating a display comprising information regarding the programme displayed in the desired
15 window upon selection of the desired window.

18. A decoder according to Claim 16 or 17, comprising means for communicating with a communications centre to obtain said information regarding the programme displayed in the desired window.
20

19. A decoder according to Claim 18, wherein said communication means comprises a modem for dialling up said communications centre to supply a request for said information to the communications centre.

25 20. A decoder according to any of Claims 4 to 14, comprising means for generating a display comprising a forthcoming programme schedule for the channel displayed in the desired window upon selection of the desired window.

30 21. A decoder for displaying of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of

-39-

a desired window within the mosaic formation, and means for generating a display comprising a forthcoming programme schedule for the channel displayed in the desired window upon selection of the desired window.

5 22. A decoder according to Claim 20 or 21, wherein said forthcoming programme schedule comprises a textual display of programme schedule information.

23. A decoder according to Claim 20 or 21, wherein said forthcoming programme schedule comprises a display of a plurality of pictorial images associated with
10 respective forthcoming programmes in respective windows of a mosaic formation

24. A decoder for controlling the display of programming schedule information, said decoder comprising means for generating a display comprising a plurality of pictorial images associated with respective forthcoming programmes on at least one
15 digital television channel in respective windows of a mosaic formation.

25. A decoder according to Claim 24, wherein said plurality of pictorial images are associated with forthcoming programmes to be shown simultaneously on respective digital television channels.
20

26. A decoder according to Claim 25, wherein said forthcoming programmes are to be shown on respective digital television channels during a future time period.

27. A decoder according to any of Claims 23 to 26, wherein at least one of said
25 plurality of pictorial images comprises video footage associated with the respective forthcoming programme.

28. A decoder according to Claim 1, wherein said receiving means is adapted to receive said access rights from a remote control handset associated with the decoder.
30

29. A decoder according to Claim 28, wherein said receiving means is adapted to receive a PIN number from the remote control handset, said decoder comprising

-40-

means for authenticating the received PIN number and, upon authentication of the received PIN number, permitting reception of the access rights.

30. A decoder according to any preceding claim, comprising means for prohibiting
5 the generation of at least a portion of video information in a said window in dependence on the access rights to one of a programme and a channel displayed in that window.

31. A decoder according to Claim 30, comprising means for controlling the
10 display of a picture in said window instead of said at least a portion of video information.

32. A decoder according to Claim 31, wherein said picture comprises a logo associated with the channel displayed in said window.

15

33. A decoder according to Claim 31, wherein said picture comprises an image associated with the programme displayed in said window.

34. A decoder according to Claim 30, comprising means for controlling the
20 display of an advertisement in said window instead of said at least a portion of video information.

35. A decoder according to Claim 30, comprising means for controlling the
25 display of further video information in said window instead of said at least a portion of video information.

36. A decoder according to Claim 35, wherein said further video information comprises promotional video information.

30 37. A decoder according to any preceding claim, comprising means for generating a message informing a user of the access rights to one of a programme and a channel in the event of the positioning of the cursor on a said window displaying said one of

a programme and a channel.

38. A decoder according to any preceding claim, comprising positional control means for controlling the relative positions of said windows within the mosaic formation.

39. A decoder according to Claim 38, wherein said positional control means is arranged to control the relative positions of said windows in response to the received access rights to the channels or programmes displayed in said windows.

10

40. A decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising positional control means for controlling the relative positions of said windows within the mosaic formation.

15

41. A decoder according to Claim 38 or 40, wherein said positional control means is arranged to control the relative positions of said windows in response to received window positioning data for controlling the relative positions of said windows within the mosaic formation.

20

42. A decoder according to Claim 41, comprising means for receiving from a remote control handset associated with the decoder said window positioning data

43. A decoder for controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, said decoder comprising means for receiving from a remote control handset associated with the decoder window positioning data, and positional control means for controlling the relative positions of said windows within the mosaic formation in response to the received positioning data.

30

44. A decoder according to any of Claims 38 to 43, wherein said positional control means is arranged to control the relative positions of the windows of the

mosaic formation according to a programme characteristic of programmes normally shown on the channels displayed in the windows.

45. A decoder according to Claim 44, wherein said positional control means is
5 arranged to group together windows which display channels having the same programme characteristic.

46. A decoder according to Claim 45, wherein said positional control means is
10 arranged to group together windows which display channels which normally show programmes having the same theme.

47. A decoder according to Claim 45, wherein said positional control means is
15 arranged to group together windows which display channels which normally show pay-per-view events.

48. A decoder according to any of Claims 38 to 47, wherein said positional
control means is arranged to maintain a window displaying one of a particular channel
and a particular programme in a constant position in the mosaic formation.

20 49. A decoder according to Claim 48, wherein said window is that window of the mosaic formation displaying the channel displayed immediately before the display of the mosaic formation.

50. A decoder comprising:
25 means for storing a plurality of interactive applications;
means for generating a display comprising a plurality of pictorial images in
respective windows of a mosaic formation, each pictorial image being associated with
a respective interactive application;
means for generating a cursor for display with the mosaic formation, said
30 cursor being selectively movable over the windows of the mosaic formation to enable
selection of a desired window within the mosaic formation; and
means for executing an interactive application upon selection of the window

displaying a pictorial image associated with that interactive application.

51. A method of controlling the display of a plurality of digital television channels
5 in respective windows of a mosaic formation, comprising receiving access rights to
one of a programme and a channel, and prohibiting full audio and visual access by
the user to said one of a programme and a channel when displayed in a said window
according to the received access rights.
- 10 52. A method according to Claim 51, wherein the access rights are received
together with audiovisual data for creating the mosaic.
53. A method according to Claim 51 or 52, wherein a cursor is generated for
display with the mosaic formation, said cursor being selectively movable over the
15 windows of the mosaic formation to enable selection of a desired window within the
mosaic formation.
54. A method according to Claim 53, wherein audio information associated with
a particular channel is generated in response to the positioning of the cursor over a
20 said window displaying said particular channel.
55. A method according to Claim 54, wherein the generation of said audio
information is prohibited according to the received access rights.
- 25 56. A method according to Claim 55, wherein the generation of said audio
information is prohibited if the cursor is positioned over said window for longer than
a predetermined length of time.
57. A method according to any of Claims 53 to 56, wherein the cursor is
30 automatically re-positioned in the event that the cursor is placed over a said window
displaying one of a programme or a channel to which full audio and visual access is
prohibited.

-44-

58. A method according to Claim 57, wherein the cursor is repositioned after the expiry of a predetermined period of time.

59. A method according to any of Claims 53 to 58, wherein an attribute of the
5 cursor is changed depending on a characteristic of at least one of the programme and channel displayed in the window over which the cursor is positioned.

60. A method of controlling the display of a plurality of digital television channels
10 in respective windows of a mosaic formation, comprising generating a cursor for display with the mosaic formation, said cursor being movable to select a desired channel within the mosaic formation, and changing an attribute of the cursor depending on a characteristic of at least one of the programme and channel displayed in the window over which the cursor is positioned.

15 61. A method according to Claim 59 or 60, wherein the colour of said cursor is changed depending on said characteristic of at least one of the programme and channel displayed in the window over which the cursor is positioned.

62. A method according to any of Claims 59 to 61, wherein data for assigning
20 said characteristic is received from a remote control handset associated with the decoder, said characteristic being assigned in response to said received data.

63. A method according to any of Claims 53 to 62, wherein the decoder is tuned
25 to a channel displayed in the desired window upon selection of the desired window.

64. A method according to any of Claims 53 to 62, wherein a display comprising
information regarding the programme displayed in the desired window is generated upon selection of the desired window.

30 65. A method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, comprising generating a cursor for display with the mosaic formation, said cursor being selectively movable over the

windows of the mosaic formation to enable selection of a desired window within the mosaic formation, and generating a display comprising information regarding the programme displayed in the desired window upon selection of the desired window.

5 66. A method according to Claim 64 or 65, comprising communicating with a communications centre to obtain said information regarding the programme displayed in the desired window.

67. A method according to Claim 66, comprising dialling up said communications
10 centre to supply a request for said information to the communications centre.

68. A method according to any of Claims 53 to 62, wherein a display comprising a forthcoming programme schedule for the channel displayed in the desired window is generated upon selection of the desired window.

15

69. A method of displaying of a plurality of digital television channels in respective windows of a mosaic formation, comprising generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic
20 formation, and generating a display comprising a forthcoming programme schedule for the channel displayed in the desired window upon selection of the desired window.

70. A method according to Claim 68 or 69, wherein said forthcoming programme
25 schedule comprises a textual display of programme schedule information.

71. A method according to Claim 68 or 69, wherein said forthcoming programme schedule comprises a display of a plurality of pictorial images associated with respective forthcoming programmes in respective windows of a mosaic formation

30

72. A method of controlling the display of programming schedule information, comprising generating a display comprising a plurality of pictorial images associated

with respective forthcoming programmes on at least one digital television channel in respective windows of a mosaic formation.

73. A method according to Claim 72, wherein said plurality of pictorial images
5 are associated with forthcoming programmes to be shown simultaneously on respective digital television channels.

74. A method according to Claim 73, wherein said forthcoming programmes are to be shown on respective digital television channels during a future time period.

10

75. A method according to any of Claims 71 to 74, wherein at least one of said plurality of pictorial images comprises video footage associated with the respective forthcoming programme.

15 76. A method according to Claim 51, wherein said access rights are received from a remote control handset associated with the decoder.

77. A method according to Claim 76, wherein a PIN number is received from the remote control handset, the received PIN number being authenticated to, upon
20 authentication of the received PIN number, permit reception of the access rights.

78. A method according to any of Claims 51 to 77, wherein the generation of at least a portion of video information in a said window is prohibited in dependence on the access rights to one of a programme and a channel displayed in that window.

25

79. A method according to Claim 78, wherein a picture is displayed in said window instead of said at least a portion of video information.

80. A method according to Claim 79, wherein said picture comprises a logo
30 associated with the channel displayed in said window.

81. A method according to Claim 80, wherein said picture comprises an image

associated with the programme displayed in said window.

82. A method according to Claim 78, wherein an advertisement is displayed in said window instead of said at least a portion of video information.

5

83. A method according to Claim 78, wherein further video information is displayed in said window instead of said at least a portion of video information.

84. A method according to Claim 83, wherein said further video information
10 comprises promotional video information.

85. A method according to any of Claims 51 to 84, wherein a message is generated informing a user of the access rights to one of a programme and a channel in the event of the positioning of the cursor on a said window displaying said one of
15 a programme and a channel.

86. A method according to any of Claims 51 to 85, comprising controlling the relative positions of said windows within the mosaic formation.

20 87. A method according to Claim 86, wherein the relative positions of said windows are controlled in response to the received access rights to the channels or programmes displayed in said windows.

88. A method of controlling the display of a plurality of digital television channels
25 in respective windows of a mosaic formation, comprising controlling the relative positions of said windows within the mosaic formation.

89. A method according to Claim 86 or 88, wherein the relative positions of said windows are controlled in response to received window positioning data for
30 controlling the relative positions of said windows within the mosaic formation.

90. A method according to Claim 89, wherein said window positioning data is

-48-

received from a remote control handset associated with the decoder.

91. A method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation, comprising receiving from a remote control handset associated with the decoder window positioning data, and controlling the relative positions of said windows within the mosaic formation in response to the received positioning data.

92. A method according to any of Claims 86 to 91, wherein the relative positions of the windows of the mosaic formation are controlled according to a programme characteristic of programmes normally shown on the channels displayed in the windows.

93. A method according to Claim 92, wherein windows which display channels having the same programme characteristic are grouped together.

94. A method according to Claim 93, wherein windows which display channels which normally show programmes having the same theme are grouped together.

95. A method according to Claim 93, wherein windows which display channels which normally show pay-per-view events are grouped together.

96. A method according to any of Claims 86 to 95, wherein a window displaying one of a particular channel and a particular programme is maintained in a constant position in the mosaic formation.

97. A method according to Claim 96, wherein said window is that window of the mosaic formation displaying the channel displayed immediately before the display of the mosaic formation.

98. A method of controlling a decoder, said method comprising the steps of:
storing a plurality of interactive applications;

-49-

generating a display comprising a plurality of pictorial images in respective windows of a mosaic formation, each pictorial image being associated with a respective interactive application;

5 generating a cursor for display with the mosaic formation, said cursor being selectively movable over the windows of the mosaic formation to enable selection of a desired window within the mosaic formation; and

executing an interactive application upon selection of the window displaying a pictorial image associated with that interactive application.

10 99. A decoder substantially as herein described with reference to the accompanying drawings.

100. A method of controlling the display of a plurality of digital television channels in respective windows of a mosaic formation substantially as herein described with
15 reference to the accompanying drawings.
